## Verification Analysis of the Slope Stability

## Program: Slope Stability

File: Demo_vm_en_03.gst

In this verification manual you will find hand-made verification analysis of the stability of slope and anchored slope in a permanent design situation. The results of the hand-made calculations are compared with the results from the GEO5 - Slope Stability program.

## Terms of Reference:

In Figure 1, an example of a slope is shown. The slope has a height $H=10.0 \mathrm{~m}$ and is adjusted in 1:1.5 inclination. At the top of the slope is a load $f=20 \mathrm{kN} / \mathrm{m}^{2}$. The earth body is formed of sandy clay (CS). The properties of soil (effective values) are shown in Table 1. The calculation is divided into two stages. In the $1^{\text {st }}$ stage the stability of the slope is calculated and in the $2^{\text {nd }}$ stage the stability of an anchored slope is calculated. The slope stability is calculated using Fellenius/Petterson method and Bishop's simplified method (the circular slip surface). The verification methodology of the slope stability is done according to safety factors.

Table 1 Soil properties - effective values

## 1. Fellenius/Petterson Method

## Verification of the Stability of the Slope

The slip surface was determined. In this case the slip surface is determined by a circle with its centre at point $O=[x, z]=[13.5279 ; 18.9443]$ and a radius $R=15.00 \mathrm{~m}$. Points $Z_{s p}$ and $K_{s p}$ indicate the beginning and end of the slip surface. The slope was divided into vertical blocks of width $b_{i}=1.0 \mathrm{~m}$. In Figure 2, a slope divided into 20 blocks is shown.

Figure 2 Slope - vertical blocks

Figure 3 Static scheme of the block

Calculation of the weight of the individual blocks of the slope. The weight of the blocks of the earth body bounded by the slip surface are calculated. The overall calculation is shown in Table 2. An example of the calculation for block number 13 is done.

- Determination of the area above the ground water table (the area $A$ ) and under the ground water table (the area $B$ ):

$$
\begin{aligned}
& A_{13}=2.100 \mathrm{~m}^{2} \\
& B_{13}=4.2249 \mathrm{~m}^{2}
\end{aligned}
$$

- Weight of the individual parts of the block:
$A_{W, 13}=A_{13} \cdot \gamma=2.100 \cdot 18.50=38.8500 \mathrm{kN} / \mathrm{m}$
$B_{W, 13}=B_{13} \cdot \gamma_{\text {sat }}=4.2249 \cdot 19.50=82.3856 \mathrm{kN} / \mathrm{m}$
- Weight force of the block:
$W_{13}=A_{W, 13}+B_{W, 13}=38.8500+82.3856=121.236 \mathrm{kN} / \mathrm{m}$
- Calculation for all blocks:

| Block | Area of the part |  | Width of the block | Weight of one part |  | Weight of the block | Load |

Table 2 Weight and forces of the load

Determination of the inclination of the slip surface of the individual blocks and calculation of the pore pressure. To simplify the hand-made calculation the circle slip surfaces of the individual blocks have been replaced by lines. The inclination of the slip surface is determined by the angle between the slip surface and the horizontal plane.

The height of the ground water table must be determined for the calculation of the pore pressure. The height of the ground water table $h_{i}$ is considered to the axis of the block. The unit weight of water is $\gamma_{w}=10.00 \mathrm{kN} / \mathrm{m}^{3}$. The heights of the ground water table on the left and right side of the block must be determined for the calculation of the horizontal forces of the pore pressure. The overall calculation is shown in Table 3. An example of the calculation for block number 13 is done.

- Inclination of the slip surface:
$\alpha_{13}=27.7192^{\circ}$
- Length of the slip surface:
$l_{13}=\frac{b_{13}}{\cos \left(\alpha_{13}\right)}=\frac{1.000}{\cos (27.7192)}=1.130 \mathrm{~m}$
- Inclination of the ground water table:
$\alpha_{w, 13}=25.0169^{\circ}$
- Height of the ground water table:
$h_{13}=4.2369 \mathrm{~m}$
- Calculation of the reduced height of the ground water table:
$h_{r, 13}=h_{13} \cdot \cos \left(\alpha_{w, 13}\right)^{2}=4.2369 \cdot \cos (25.0169)^{2}=3.479 \mathrm{~m}$
- Calculation of the pore pressure:
$u_{13}=\gamma_{w} \cdot h_{r, 13}=10.00 \cdot 3.479=34.790 \mathrm{kPa}$
- Calculation of the horizontal forces of the pore pressure:
$U_{H L, 13}=\frac{\left[h_{L, 13} \cdot \cos \left(\alpha_{w, 13}\right)\right]^{2} \cdot \gamma_{w}}{2}=\frac{[4.2543 \cdot \cos (25.0169)]^{2} \cdot 10}{2}=74.312 \mathrm{kN} / \mathrm{m} \quad$ - left side
$U_{H P, 13}=\frac{\left[h_{P, 13} \cdot \cos \left(\alpha_{w, 13}\right)\right]^{2} \cdot \gamma_{w}}{2}=\frac{[4.1955 \cdot \cos (25.0169)]^{2} \cdot 10}{2}=72.272 \mathrm{kN} / \mathrm{m} \quad$ - right side
- Calculation for all blocks:

| Block | Inclination of the slip surface | Length of the slip surface | Ground water table |  |  | Pore pressure |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Inclination of the ground water table | Height of the ground water table | Reduced height of the ground water table |  |

## Table 4 Horizontal forces of the pore pressure

Calculation of the sliding moment. The weight of the individual blocks including forces of the load act on the horizontal arm from axis of the block to the centre of the circular slip surface (to the point 0 ). The arms of the forces are calculated from the beginning of the slip surface $\left(Z_{s p}=[x, z]=[8.00 ; 5.00]\right)$. The overall calculation is in Table 5. An example of the calculation for block number 13 is done.

- Calculation of the moment arm:

$$
r_{a, 13}=X_{z s p}-X_{o}+\left(i \cdot b-\frac{b}{2}\right)=8.0000-13.5729+\left(13 \cdot 1.0-\frac{1.0}{2}\right)=6.972 m
$$

- Calculation of the sliding moment:

$$
M_{a, 13}=\left(W_{13}+f_{13}\right) \cdot r_{a, 13}=(121.236+0.000) \cdot 6.972=845.257 \mathrm{kNm} / \mathrm{m}
$$

- Calculation for all blocks:

Table 5 Sliding moments

- Resultant sliding moment:

$$
M_{a}=\sum_{i=1}^{20} M_{a, i}=10464.338 \mathrm{kNm} / \mathrm{m}
$$

Result from the GEO5 - Slope Stability program: $M_{a}=10447.88 \mathrm{kNm} / \mathrm{m}$

- Resultant active force:

$$
F_{a}=\frac{\sum_{i=1}^{20} M_{a, i}}{R}=\frac{10464.338}{15.00}=697.623 \mathrm{kN} / \mathrm{m}
$$

Result from the GEO5 - Slope Stability program: $F_{a}=696.53 \mathrm{kN} / \mathrm{m}$

Calculation of the resisting moment. Normal forces $N_{i}$ of the individual blocks must be calculated. The normal force acts upright to the slip surface. The overall calculation is shown in Table 6. An example of the calculation for block 13 is done.

- Calculation of the safety factor FS :

$$
F S=\frac{M_{p}}{M_{a}}
$$

- Calculation of the normal force:
$N_{13}=\left(W_{13}+f_{13}\right) \cdot \cos \left(\alpha_{13}\right)-u_{13} \cdot l_{13}+\left(U_{H L, 13}-U_{H R, 13}\right) \cdot \sin \left(\alpha_{13}\right)$
$N_{13}=(121.236+0.000) \cdot \cos (27.7192)-34.790 \cdot 1.130+(74.312-72.272) \cdot \sin (27.7192)=68.959 \mathrm{kN} / \mathrm{m}$
- Calculation of the resisting moment:
$M_{p, 13}=\left[c_{13} \cdot l_{13}+N_{13} \cdot \tan (\varphi)\right] \cdot R=[21.00 \cdot 1.130+68.959 \cdot \tan (27.00)] \cdot 15.00=882.995 \mathrm{kNm} / \mathrm{m}$
- Calculation for all blocks:

| Block | Normal force | Resisting moment | Block | Normal force | Resisting moment |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} N_{i} \\ {[k N / m]} \end{gathered}$ | $\begin{gathered} M_{p, i} \\ {[k \mathrm{Nm} / \mathrm{m}]} \end{gathered}$ |  | $\begin{gathered} N_{i} \\ {[k N / m]} \end{gathered}$ | $\begin{gathered} M_{p, i} \\ {[k N m / m]} \end{gathered}$ |

Table 6 Normal forces and resisting moments

## GE05

- Resultant resisting moment:
$M_{p}=\sum_{i=1}^{20} M_{p, i}=14904.940 \mathrm{kNm} / \mathrm{m}$

Result from the GEO5 - Slope Stability program: $M_{p}=14936.16 \mathrm{kNm} / \mathrm{m}$

- Resultant passive force:
$F_{p}=\frac{\sum_{i=1}^{20} M_{p, i}}{R}=\frac{14904.940}{15.00}=993.663 \mathrm{kN} / \mathrm{m}$

Result from the GEO5 - Slope Stability program: $F_{p}=995.74 \mathrm{kN} / \mathrm{m}$

- Calculation of the safety factor:

$$
F S=\frac{M_{p}}{M_{a}}=\frac{14904.940}{10464.338}=1.424, \text { NOT OK }
$$

Result from the GEO5 - Slope Stability program: $F S=1.43$, NOT OK

## Verification of the Stability of Anchored Slope

In Figure 4, an example of anchored slope in the $2^{\text {nd }}$ stage is shown. The anchor force is $F_{A}=200.00 \mathrm{kN}$ and the spacing is $b_{A}=2.00 \mathrm{~m}$. The position of the anchor head is $H_{\text {anchor }}=[x, z]=[16.00 ; 9.00]$. The anchor head is on block number 9.

Figure 4 Anchored slope - dimensions

## - GE05

Calculation of the sliding moment. The anchor acts as a passive element, which means that active moments will be the same as in the $1^{\text {st }}$ stage.

- Resultant sliding moment:
$M_{a}=\sum_{i=1}^{20} M_{a, i}=10464.338 \mathrm{kNm} / \mathrm{m}$

Result from the GEO5 - Slope Stability program: $M_{a}=10447.88 \mathrm{kNm} / \mathrm{m}$

- Resultant active force:

$$
F_{a}=\frac{\sum_{i=1}^{20} M_{a, i}}{R}=\frac{10464.338}{15.00}=697.623 \mathrm{kN} / \mathrm{m}
$$

Result from the GEO5 - Slope Stability program: $F_{a}=696.53 \mathrm{kN} / \mathrm{m}$

Calculation of the resisting moment. The normal forces $N_{i}$ of the individual blocks must be calculated. The normal force acts perpendicular to the slip surface. Normal force on block number 9 is influenced by the anchor force. The overall calculation is shown in Table 7. An example of the calculation for block 13 is done.

- Anchor force at 1 m
$F_{A}^{\prime}=\frac{F_{A}}{b_{A}}=\frac{200.00}{2.00}=100.00 \mathrm{kN} / \mathrm{m}$
- Calculation of the arm of the anchor force:
$r_{A}=Z_{O}-Z_{\text {anchor }}=18.944-9.000=9.944 m$
- Resisting moment of the anchor:
$M_{p, A}=F_{A}^{\prime} \cdot r_{A}=100.00 \cdot 9.944=994.400 \mathrm{kNm} / \mathrm{m}$
- Calculation of the safety factor $F S$ :
$F S=\frac{M_{p}}{M_{a}}$
- Calculation of the normal force:
$N_{13}=\left(W_{13}+f_{13}\right) \cdot \cos \left(\alpha_{13}\right)-u_{13} \cdot l_{13}+\left(U_{H L, 13}-U_{H R, 13}\right) \cdot \sin \left(\alpha_{13}\right)$
$N_{13}=(121.236+0.000) \cdot \cos (27.7192)-34.790 \cdot 1.130+(74.312-72.272) \cdot \sin (27.7192)=68.959 \mathrm{kN} / \mathrm{m}$
- Calculation of the effect of the anchor force (block number 9):
$N_{A, 9}=F^{\prime}{ }_{A} \cdot \sin \left(\alpha_{9}\right)=100.000 \cdot \sin (11.4351)=19.826 \mathrm{kN} / \mathrm{m}$
- Calculation of the resisting moment:

$$
M_{p, 13}=\left[c_{13} \cdot l_{13}+N_{13} \cdot \tan (\varphi)\right] \cdot R=[21.00 \cdot 1.130+68.959 \cdot \tan (27.00)] \cdot 15.00=882.995 \mathrm{kNm} / \mathrm{m}
$$

- Calculation for all blocks:

| Block | Normal force | Resisting <br> moment | Block | Normal force | Resisting <br> moment |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $N_{i}$ <br> $[k N / m]$ | $M_{p, i}$ <br> $[k N m / m]$ |  | $M_{p, i}$ <br> $[k N m / m]$ |  |

Table 7 Normal forces and resisting moments

- Resultant resisting moment:

$$
M_{p}=\sum_{i=1}^{20} M_{p, i}+M_{p, A}=15056.467+994.400=16050.867 \mathrm{kNm} / \mathrm{m}
$$

Result from the GEO5 - Slope Stability program: $M_{p}=16081.40 \mathrm{kNm} / \mathrm{m}$

- Resultant passive force:
$F_{p}=\frac{\sum_{i=1}^{20} M_{p, i}+M_{p, A}}{R}=\frac{1605.867}{15.00}=1070.058 \mathrm{kN} / \mathrm{m}$
Result from the GEO5 - Slope Stability program: $F_{p}=1072.09 \mathrm{kN} / \mathrm{m}$
- Calculation of the safety factor:
$F S=\frac{M_{p}}{M_{a}}=\frac{16050.867}{10464.338}=1.534$, SATISFACTORY

Result from the GEO5 - Slope Stability program: $F S=1.54$, SATISFACTORY

## 2. Bishop's Simplified Method

## Verification of the Stability of the Slope

The slip surface is the same as in the first calculation using the Fellenius/Petterson method (Figure 2). The calculation of the weight of the individual blocks is shown in Table 2.

Determination of the inclination of the slip surface of the individual blocks and calculation of the pore pressure. To simplify the hand-made calculation the circular slip surfaces of the individual blocks have been replaced by lines. The inclination of the slip surface is determined by the angle between the slip surface and the horizontal plane.

The height of the ground water table must be determined for the calculation of the pore pressure. The height of the ground water table $h_{i}$ is considered to the axis of the block. The unit weight of water is $\gamma_{w}=10.00 \mathrm{kN} / \mathrm{m}^{3}$. The resultant effect of the horizontal forces of the pore pressure is not significant and had been neglected. The overall calculation is in Table 8. An example of the calculation for block 13 is done.

- Inclination of the slip surface:

$$
\alpha_{13}=27.7192^{\circ}
$$

- Inclination of the ground water table:

$$
\alpha_{w, 13}=25.0169^{\circ}
$$

- Height of the ground water table:

$$
h_{13}=4.2369 \mathrm{~m}
$$

- Calculation of the reduced height of the ground water table:
$h_{r, 13}=h_{13} \cdot \cos \left(\alpha_{w, 13}\right)^{2}=4.2369 \cdot \cos (25.0169)^{2}=3.479 m$
- Calculation of the pore pressure:
$u_{13}=\gamma_{w} \cdot h_{r, 13}=10.00 \cdot 3.479=34.790 \mathrm{kPa}$
- Calculation for all blocks:

| Block | Inclination of the slip surface | Ground water table |  |  | Pore pressure |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Inclination of the ground water table | Height of the ground water table | Reduced height of the ground water table |  |

Table 8 Inclinations of the slip surfaces and pore pressures

Calculation of the sliding moment. The weight of the individual blocks including forces of the load act on the horizontal arm from the axis of the block to the centre of the circle slip surface (to the point O ). The arms of the forces are calculated from the edge of the slip surface $\left(Z_{s p}=[x, z]=[8.00 ; 5.00]\right)$. The overall calculation is shown in Table 9. An example of the calculation for block 13 is done.

- Calculation of the arm of the force:

$$
r_{a, 13}=X_{z s p}-X_{o}+\left(i \cdot b-\frac{b}{2}\right)=8.0000-13.5729+\left(13 \cdot 1.0-\frac{1.0}{2}\right)=6.972 \mathrm{~m}
$$

- Calculation of the sliding moment:
$M_{a, 13}=\left(W_{13}+f_{13}\right) \cdot r_{a, 13}=(121.236+0.000) \cdot 6.972=845.257 \mathrm{kNm} / \mathrm{m}$
- Calculation for all blocks:

| Block | Sliding moment |  | Sliding moment |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $r_{a, i}$ <br> $[\mathrm{~m}]$ | $M_{a, i}$ <br> $[\mathrm{kNm} / \mathrm{m}]$ |  | $M_{a, i}$ <br> $[\mathrm{kNm} / \mathrm{m}]$ |  |

Table 9 Sliding moments

- Resultant sliding moment:
$M_{a}=\sum_{i=1}^{20} M_{a, i}=10464.338 \mathrm{kNm} / \mathrm{m}$

Result from the GEO5 - Slope Stability program: $M_{a}=10447.88 \mathrm{kNm} / \mathrm{m}$

- Resultant active force:

$$
F_{a}=\frac{\sum_{i=1}^{20} M_{a, i}}{R}=\frac{10464.338}{15.00}=697.623 \mathrm{kN} / \mathrm{m}
$$

Result from the GEO5 - Slope Stability program: $F_{a}=696.53 \mathrm{kN} / \mathrm{m}$

Calculation of the resisting moment. The calculation of the resisting moments is iterative because the calculation of the resisting moments according to Bishop's method depends on the safety factor $F S$. In the $1^{\text {st }}$ iteration the safety factor $F S=1.500$ is considered. Five iterations are done in the hand-made calculation. The overall calculation is shown in Table 10. An example of the calculation for block 13 is done.

- Calculation of the safety factor $F S$ in the individual iterations:

$$
F S=\frac{M_{p}}{M_{a}}
$$

- Calculation of the resisting moment, $F S=1.500$ :

$$
\begin{aligned}
& M_{p, 13}=\frac{c \cdot b_{13}+\left(W_{13}+f_{13}-u_{13} \cdot b_{13}\right) \cdot \tan (\varphi)}{\cos \left(\alpha_{13}\right)+\frac{\tan (\varphi) \cdot \sin \left(\alpha_{13}\right)}{F S}} \cdot R \\
& M_{p, 13}=\frac{21.00 \cdot 1.00+(121.236+0.00-34.790 \cdot 1.00) \cdot \tan (27.00)}{\cos (27.7192)+\frac{\tan (27.00) \cdot \sin (27.7192)}{1.500}} \cdot 15.00=935.258 \mathrm{kNm} / \mathrm{m}
\end{aligned}
$$

$$
\rightarrow F S=1.546 \quad \text { - result of the } 1^{\text {st }} \text { iteration }
$$

- Calculation of the resisting moment, $F S=1.546$ :

$$
M_{p, 13}=\frac{21.00 \cdot 1.00+(121.236+0.00-34.790 \cdot 1.00) \cdot \tan (27.00)}{\cos (27.7192)+\frac{\tan (27.00) \cdot \sin (27.7192)}{1.546}} \cdot 15.00=939.492 \mathrm{kNm} / \mathrm{m}
$$

$$
\rightarrow F S=1.553 \quad-\text { result of the } 2^{\text {nd }} \text { iteration }
$$

- Calculation of the resisting moment, $F S=1.553$ :

$$
M_{p, 13}=\frac{21.00 \cdot 1.00+(121.236+0.00-34.790 \cdot 1.00) \cdot \tan (27.00)}{\cos (27.7192)+\frac{\tan (27.00) \cdot \sin (27.7192)}{1.553}} \cdot 15.00=940.117 \mathrm{kNm} / \mathrm{m}
$$

$\rightarrow F S=1.554 \quad$ - result of the $3^{\text {rd }}$ iteration

- Calculation of the resisting moment, $F S=1.554$ :

$$
\begin{aligned}
& M_{p, 13}=\frac{21.00 \cdot 1.00+(121.236+0.00-34.790 \cdot 1.00) \cdot \tan (27.00)}{\cos (27.7192)+\frac{\tan (27.00) \cdot \sin (27.7192)}{1.554}} \cdot 15.00=940.206 \mathrm{kNm} / \mathrm{m} \\
& \rightarrow F S=1.554 \quad \text { - result of the } 4^{\text {th }} \text { iteration }
\end{aligned}
$$

- Calculation of the resisting moment, $F S=1.554$ :

$$
\begin{aligned}
& M_{p, 13}=\frac{21.00 \cdot 1.00+(121.236+0.00-34.790 \cdot 1.00) \cdot \tan (27.00)}{\cos (27.7192)+\frac{\tan (27.00) \cdot \sin (27.7192)}{1.554}} \cdot 15.00=940.206 \mathrm{kNm} / \mathrm{m} \\
& \rightarrow F S=1.554 \quad \text { - result of the } 5^{\text {th }} \text { iteration }
\end{aligned}
$$

- Calculation for all blocks:

| Block | $1^{\text {st }}$ iteration |  | $2^{\text {nd }}$ iteration |  | $3^{\text {rd }}$ iteration |  | $4^{\text {th }}$ iteration |  | $5^{\text {th }}$ iteration |  |

Table 10 Resisting moments and safety factors

- Resultant resisting moment in $5^{\text {th }}$ iteration:
$M_{p}=\sum_{i=1}^{20} M_{p, i}=16264.697 \mathrm{kNm} / \mathrm{m}$

Result from the GEO5 - Slope Stability program: $M_{p}=16280.28 \mathrm{kNm} / \mathrm{m}$

- Resultant passive force:

$$
F_{p}=\frac{\sum_{i=1}^{20} M_{p, i}}{R}=\frac{16264.697}{15.00}=1084.313 \mathrm{kN} / \mathrm{m}
$$

Result from the GEO5 - Slope Stability program: $F_{p}=1085.35 \mathrm{kN} / \mathrm{m}$

- Calculation of the safety factor in $5^{\text {th }}$ iteration:
$F S=\frac{M_{p}}{M_{a}}=\frac{16264.697}{10464.338}=1.554$, SATISFACTORY

Result from the GEO5 - Slope Stability program: $F S=1.56$, SATISFACTORY

## Verification of the Stability of Anchored Slope

In Figure 4, an example of anchored slope in $2^{\text {nd }}$ stage is shown. The anchor force is $F_{A}=200.00 \mathrm{kN}$ and the spacing is $b_{A}=2.00 \mathrm{~m}$. The position of the anchor head is $H_{\text {anchor }}=[x, z]=[16.00 ; 9.00]$.

Calculation of the sliding moment. The anchor acts as a passive element, which means that active moments will be the same as in the $1^{\text {st }}$ stage.

- Resultant sliding moment:
$M_{a}=\sum_{i=1}^{20} M_{a, i}=10464.338 \mathrm{kNm} / \mathrm{m}$

Result from the GEO5 - Slope Stability program: $M_{a}=10447.88 \mathrm{kNm} / \mathrm{m}$

- Resultant active force:

$$
F_{a}=\frac{\sum_{i=1}^{20} M_{a, i}}{R}=\frac{10464.338}{15.00}=697.623 \mathrm{kN} / \mathrm{m}
$$

Result from the GEO5 - Slope Stability program: $F_{a}=696.53 \mathrm{kN} / \mathrm{m}$

Calculation of the resisting moment. The anchor force enters the calculation of the resisting moments. The calculation of the resisting moments is iterative because the calculation of the resisting moments using the Bishop's method depends on the safety factor FS. In the $1^{\text {st }}$ iteration the safety factor is $F S=1.500$. Five iterations are done in the hand-made calculation. The overall calculation is shown in Table 11. An example of the calculation for block 13 is done.

- Anchor force at 1 m :

$$
F_{A}^{\prime}=\frac{F_{A}}{b_{A}}=\frac{200.00}{2.00}=100.00 \mathrm{kN} / \mathrm{m}
$$

- Calculation of the arm of the anchor force:

$$
r_{A}=Z_{O}-Z_{\text {anchor }}=18.944-9.000=9.944 \mathrm{~m}
$$

- Resisting moment of the anchor:

$$
M_{p, A}=F_{A}^{\prime} \cdot r_{A}=100.00 \cdot 9.944=994.400 \mathrm{kNm} / \mathrm{m}
$$

- Calculation of the safety factor $F S$ in the individual iterations:

$$
F S=\frac{M_{p}}{M_{a}}
$$

- Calculation of the resisting moment, $F S=1.500$ :

$$
\begin{aligned}
& M_{p, 13}=\frac{c \cdot b_{13}+\left(W_{13}+f_{13}-u_{13} \cdot b_{13}\right) \cdot \tan (\varphi)}{\cos \left(\alpha_{13}\right)+\frac{\tan (\varphi) \cdot \sin \left(\alpha_{13}\right)}{F S}} \cdot R \\
& M_{p, 13}=\frac{21.00 \cdot 1.00+(121.236+0.00-34.790 \cdot 1,00) \cdot \tan (27.00)}{\cos (27.7192)+\frac{\tan (27.00) \cdot \sin (27.7192)}{1.500}} \cdot 15.00=935.258 \mathrm{kNm} / \mathrm{m}
\end{aligned}
$$

$$
\rightarrow F S=1.641 \quad \text { - result of the } 1^{\text {st }} \text { iteration }
$$

- Calculation of the resisting moment, $F S=1.641$ :

$$
\begin{aligned}
& M_{p, 13}=\frac{21.00 \cdot 1.00+(121.236+0.00-34.790 \cdot 1.00) \cdot \tan (27.00)}{\cos (27.7192)+\frac{\tan (27.00) \cdot \sin (27.7192)}{1.641}} \cdot 15.00=947.589 \mathrm{kNm} / \mathrm{m} \\
& \rightarrow F S=1.662 \quad-\text { result of the } 2^{\text {nd }} \text { iteration }
\end{aligned}
$$

- Calculation of the resisting moment, $F S=1.662$ :

$$
M_{p, 13}=\frac{21.00 \cdot 1.00+(121.236+0.00-34.790 \cdot 1.00) \cdot \tan (27.00)}{\cos (27.7192)+\frac{\tan (27.00) \cdot \sin (27.7192)}{1.662}} \cdot 15.00=949.272 \mathrm{kNm} / \mathrm{m}
$$

$\rightarrow F S=1.665 \quad$ - result of the $3^{\text {rd }}$ iteration

- Calculation of the resisting moment, $F S=1.665$ :

$$
M_{p, 13}=\frac{21.00 \cdot 1.00+(121.236+0.00-34.790 \cdot 1.00) \cdot \tan (27.00)}{\cos (27.7192)+\frac{\tan (27.00) \cdot \sin (27.7192)}{1.665}} \cdot 15.00=949.509 \mathrm{kNm} / \mathrm{m}
$$

$\rightarrow F S=1.665 \quad$ - result of the $4^{\text {th }}$ iteration

- Calculation of the resisting moment, $F S=1.665$ :

$$
M_{p, 13}=\frac{21.00 \cdot 1.00+(121.236+0.00-34.790 \cdot 1.00) \cdot \tan (27.00)}{\cos (27.7192)+\frac{\tan (27.00) \cdot \sin (27.7192)}{1.665}} \cdot 15.00=949.509 \mathrm{kNm} / \mathrm{m}
$$

$\rightarrow F S=1.665 \quad-$ result of the $5^{\text {th }}$ iteration

- Calculation for all blocks:

Table 11 Resisting moments and safety factors

## GE05

- Resultant resisting moment in $5^{\text {th }}$ iteration:
$M_{p}=\sum_{i=1}^{20} M_{p, i}+M_{p, A}=16433.805+994.400=17428.205 \mathrm{kNm} / \mathrm{m}$

Result from the GEO5 - Slope Stability program: $M_{p}=17442.70 \mathrm{kNm} / \mathrm{m}$

- Resultant passive force:
$F_{p}=\frac{\sum_{i=1}^{20} M_{p, i}+M_{p, A}}{R}=\frac{16433.805+994.400}{15.00}=1161.880 \mathrm{kN} / \mathrm{m}$
Result from the GEO5 - Slope Stability program: $F_{p}=1162.85 \mathrm{kN} / \mathrm{m}$
- Calculation of the safety factor in $5^{\text {th }}$ iteration:
$F S=\frac{M_{p}}{M_{a}}=\frac{17428.205}{10464.338}=1.665$, SATISFACTORY

Result from the GEO5 - Slope Stability program: $F S=1.67$, SATISFACTORY
